

Above are T2 Coronal and Axial MRI Brain images of a 3year old child who presented with Chronic Left sided weakness. On examination weight for height plots between +1 and +2sd and noted to be macrocephalic with Left sided Hemiplegia. No stigmata of Tuberculous and not toxic.

1. Describe the MRI Abnormalities.
2. What is the differential diagnosis based on MRI Findings?
3. What are the Laboratory Investigations that would aid in the diagnosis?
4. Name one confirmatory investigation and the diagnosis of the child.
5. What are the modalities of treatment and outcome?
